

TECH NOTE: 441-001

Directions to change rear tire and/or tube on a folding bike

With a blanket or some padding on the ground turn the bike upside down. This may require some assistance.

Loosen the axle bolts and remove the bottom bolt on the brake arm (which is now on top) and slightly loosen the other brake arm bolt.

Remove the wire to the motor from the frame hooks and start to remove the wheel assembly

Disengage the chain from the rear hub

PLEASE NOTE WHERE ALL THE WASHERS AND SPACERS ON THE REAR WHEEL GO.

With a helper lay the bike on the right side and flip the tire onto the frame of the bike. You may want to have a blanket or padding there as well. You are now ready to change the tire and or the tube as on any bike. Never use sharp tools when changing a bike tire or tube.

NOTE: We do not want the wheel assembly to be hanging from the bike by the wire. We cannot warranty the damage that could be caused by improper or careless work.
